

Your Trusted Partner in Cybersecurity Compliance

EndpointGuard

QuadShield's Endpoint
&
Network Protection Service

Service Overview

EndpointGuard is an integrated cybersecurity defense layer designed to safeguard networks, endpoints, and users from known and unknown threats. It combines exploit detection, malware defense, ransomware containment, and automated remediation to provide comprehensive protection across an organization's digital environment. This service is ideal for businesses aiming to maintain a proactive security posture and ensure business continuity by stopping threats before they cause damage.

Deliverables

- Endpoint and Network Protection Plan
- Monthly Threat Activity Reports
- Incident Timeline Reports with MITRE ATT&CK Mapping
- Real-time Alert Notifications
- Quarantine Reports and Remediation Logs

Client Value Proposition

- Prevents costly ransomware infections and data loss
- Reduces IT workload via automated response to threats
- Supports incident response and compliance investigations
- Helps prove continuous protection to auditors and insurers

Use Cases

- Small and medium business (SMB) endpoint protection
- Proactive defense against zero-day threats and ransomware
- Audit readiness with protection logs and reports
- IT environments with limited in-house security expertise

Technical Architecture & Capabilities

EndpointGuard integrates with existing antivirus and EDR solutions or operates independently via a cloud-managed lightweight agent. It uses kernel-level hooks and API monitoring to detect malicious behavior and uses rule engines to enforce protection policies. Data collected is stored securely and used for analytics, reporting, and correlation across endpoints and network layers.

Workflow Integration

EndpointGuard supports webhook and API-based integration with SIEM platforms and incident response tools. It can generate tickets automatically within Jira, ServiceNow, or Microsoft Defender, and includes integration support for remote device control platforms.

Reporting and Evidence Collection

Protection and incident logs are retained in tamper-proof formats and available for export during audits. Reports include detection summaries, incident timelines, threat origin, and remediation outcomes. Detailed device logs support regulatory and insurance claims validation.
