

Your Trusted Partner in Cybersecurity Compliance

RiskSight

QuadShield's Risk Assessment

&

Threat Visibility Service

Service Overview

RiskSight provides organizations with continuous visibility into their threat exposure and system vulnerabilities through both internal and external vulnerability scanning. Designed to meet the needs of security teams preparing for compliance and risk mitigation, it offers scheduled and on-demand scanning capabilities that help identify misconfigurations, unpatched software, weak credentials, and network-based risks.

Deliverables

- Internal Vulnerability Report with device-level issue breakdown
- External Vulnerability Scan Report with remediation suggestions
- Summary Infographics (Risk Heatmaps, CVSS Distribution Charts)
- Compliance-aligned reports (NIST, ISO, PCI DSS)
- Executive Summary Report (non-technical presentation)

Client Value Proposition

- Detect threats before exploitation through proactive scanning
- Reduce remediation time with prioritized, actionable findings
- Meet vulnerability scanning requirements for multiple standards
- Avoid reputational and operational damage from unpatched systems

Use Cases

- Quarterly or monthly vulnerability scanning for audit readiness
- Third-party risk assessments and due diligence
- Post-breach assessments and hardening initiatives
- Compliance-driven technical control validation

Technical Architecture & Capabilities

RiskSight operates through a lightweight agentless scanner deployed in the customer network or cloud infrastructure. The scanner leverages authenticated scanning over SSH/WinRM as well as unauthenticated checks for perimeter scanning. All scan data is encrypted in transit and stored in compliance with ISO 27001-certified cloud storage. The system also supports credential vaults, exclusion lists, and bandwidth throttling for sensitive environments.

Workflow Integration

Assessment results can be pushed to SIEM platforms (Splunk, Sentinel), vulnerability management platforms (Tenable, Qualys), or ticketing systems like Jira and ServiceNow for automated remediation workflows. Custom APIs support integration with in-house dashboards.
